

Bee Informed Partnership
 Tech Team Summary Report for All History in Your Operation

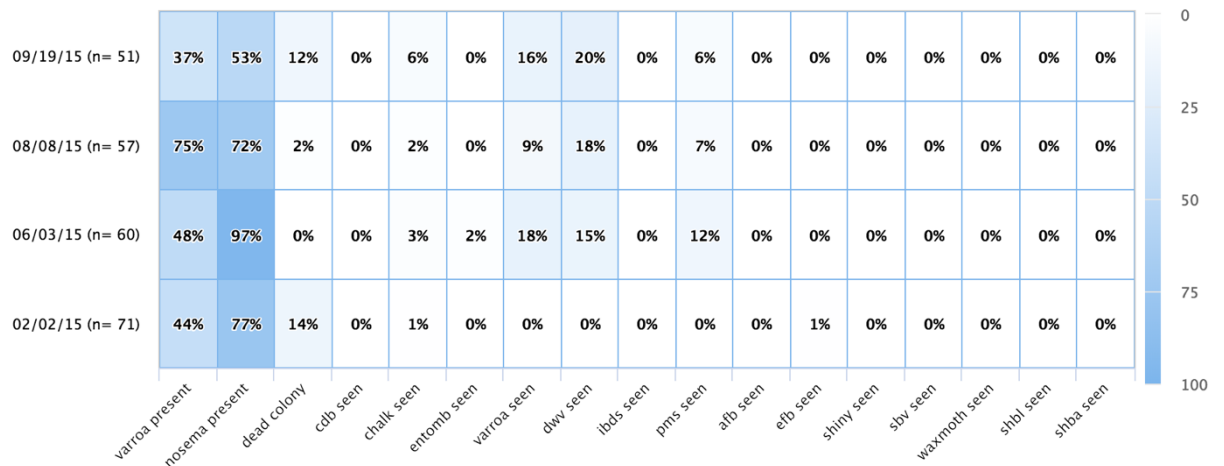

Beekeeper: AT-TN Your Tech Team: Demo
 Report date: 02/07/19
 Date Range for Report: 02/01/15 - 02/01/16

As in other summary reports, the scatter plots (varroa load, nosema load and frames of bees) are color coded by quartiles, representing the lowest, lower, upper and highest values. The color legend for the quartiles is given in each graph.

In the last two graphs, the presence of observed diseases and condition are recorded in both 1) counts of the number of colonies with the condition found and 2) the percentage of colonies with the condition found. For these last two graphs, instead of reporting the number of colonies checked for each condition (which could vary) the number of samples (n =) is reported based on the number of colonies that had varroa samples taken, which is likely to be the number of colonies checked for these conditions. If you have any questions, don't hesitate to contact us.

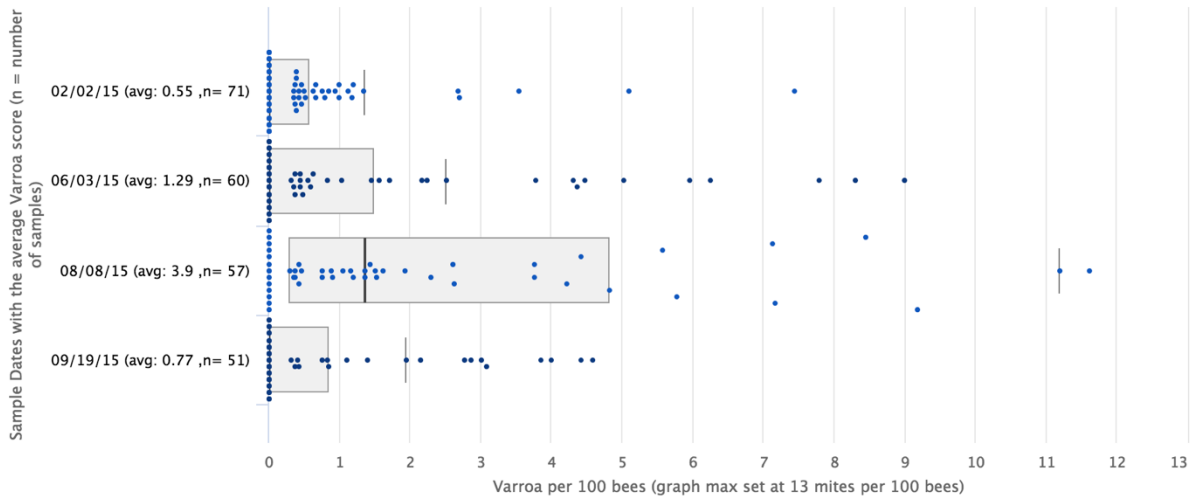

Sincerely, The Bee Informed Partnership Team
